Hypertension Care

Blood pressure (BP) in control: % of Mt. Ascutney patients with hypertension whose last BP measurement was in control

Measure Definition The percentage of patients 18 to 85 years of age with a diagnosis of

hypertension whose blood pressure was adequately controlled (<140/90) at their last measurement. No measurement within twelve months is considered not in control. Measure is NQF 0018 (definition here). Note

the NQF specs changed slightly from 2018 – 2019.

Source Local clinical data from Mt. Ascutney Hospital and Health Center

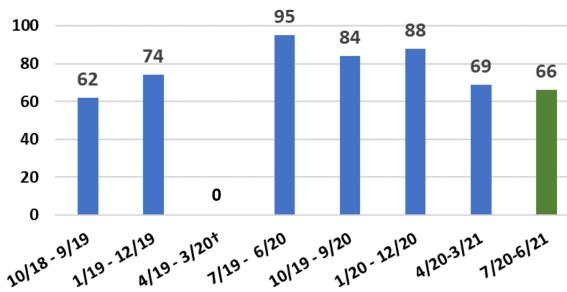

Improvement Work

- Pandemic-related diet and activity changes have impacted chronic disease management.
- CCNs report success in helping most patients be within hypertension goal "within one to two visits"!
- PCPs documenting real-time values from patients' trusted home monitors with a 'home BP' comment; do not count for this measure.
- Monthly data shows improvement of 11 percentage points, from January to June
- Still an opportunity for improvement in use of BpTRU™ and documentation of second BP value before encounter note is closed.

Diabetes Care

Definitions

- CCNs have best practice order sets for labs, patient education, and follow-up.
- We continue to see the positive changes in both groups of interest.
- We have implemented the new Diabetic Medications Refill Policy with the goal to have every patient with diabetes be seen in the clinic at least twice a year.
- We are working to allow our providers at OHC to check A1c level before a patient's encounter.

In chart A, "patients with diabetes" means patients

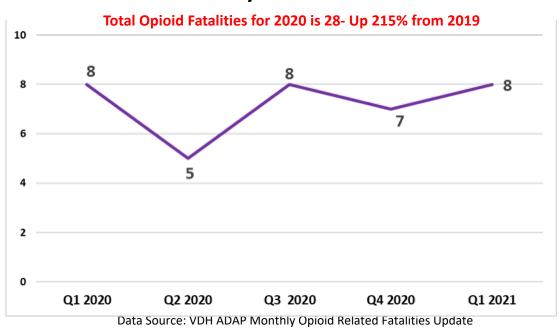

with most recent A1c ≥ 6.5% at any time within

- In chart B, "patients with diabetes" are identified through an active diagnosis code in the Cerner EHR. Local clinical data from MAHHC Patients Source
- Reflects lack of reported data due to COVID-19

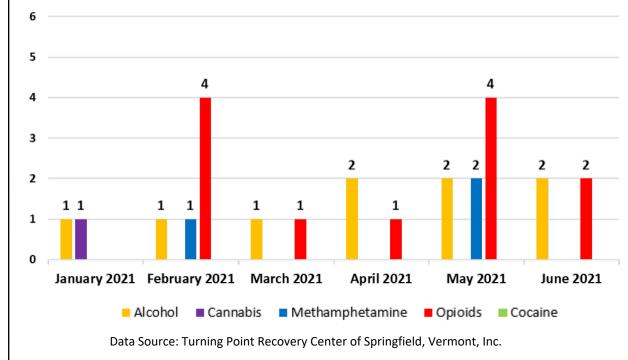

reported 12 months.

Substance Use Disorder Statistics

A. Quarterly Opioid Related Fatalities for Windsor County Residents

B. Monthly Recovery Coach Visits by Substance

Vermont Key Points

- The number of opioid-overdose fatalities increased 115% between 2019 and 2020.
- Compared to 2019:
 - A higher percentage of fatalities were female.
 - A higher percentage involved fentanyl.
 - A lower percentage of deaths involved cocaine.

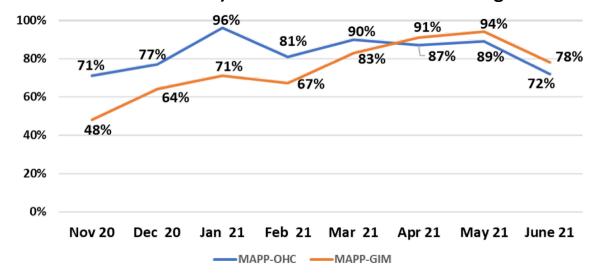

| Results by Referrals Made | | | Results by extended Quarterly Follow Up | |
|---|--------------------|------|--|----------|
| | Grand Total | | | - |
| Referrals Made | 26 | | | Grand To |
| Agreed to meet with a Recovery Coach | 24 | 92% | Quarterly Follow Up Responses | 4 |
| Agreed to receive follow up calls | 23 | 88% | Identified as still being in Recovery | 4 |
